

Cheaper Better Faster

How using modern electronics and open source libraries in python;

- advanced data collection and analysis systems;**
- can be made at very economic costs.**

Cheaper - using low cost electronics + Pi + Open Source Python Libraries

Better - better for fast design, + retrofit, + sensor choice & range, + AI Libraries.

Faster - faster to deploy + over the air data transfer in 4G, 5G, WiFi and Bluetooth.

High Level Design ...

Data Creation

Physical data is captured by sensors - and digitised.

00100010111001010100101010110101010101010101 ... etc

Data Removal

The data is removed and transmitted by WiFi / 4G / 5G / BLE Mesh, Open RAN / WiFi Networks etc ...

Data Processing

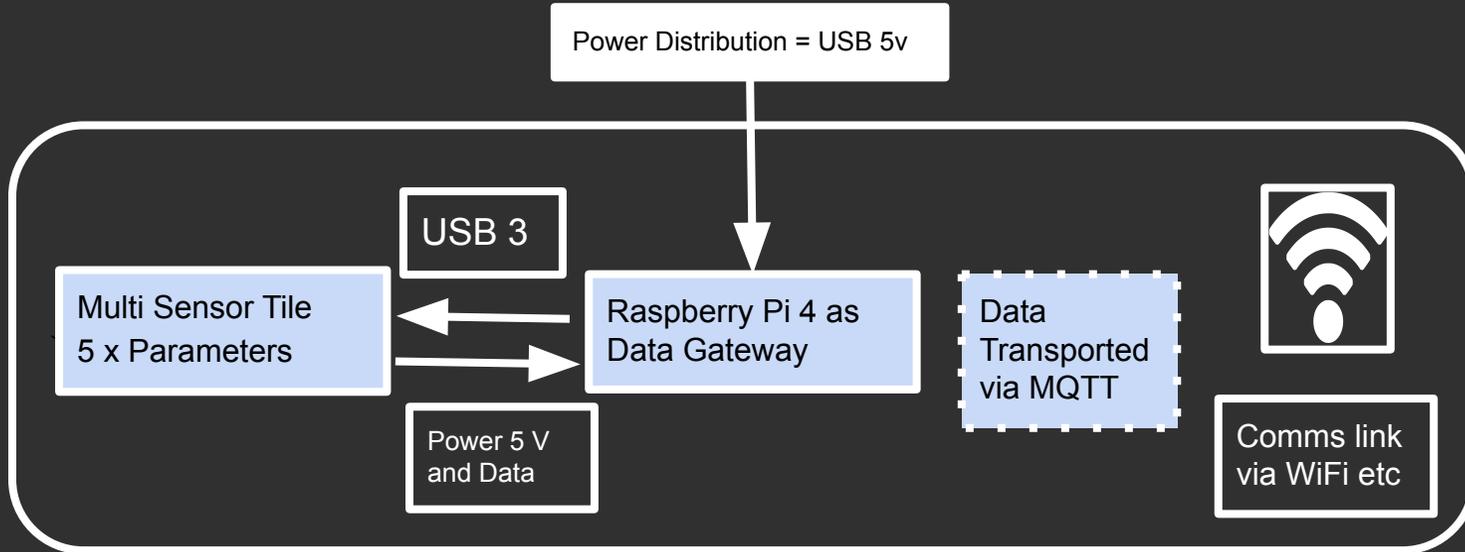

Sensor Data is then delivered to the Data Processing service cleaned, filtered and the presented for analytic analysis.

Add in PLC Data and combine for X,Y effects.

Data Reporting

Once analytic analysis is complete the data is then stored and presented via a REACT Reporting Tools.

Low Cost - High Value Data

£95.00 + £10.00 + £30.00 + Open Source = Not Too Much

Machinery House
(housing the motors, PLC, trolley drives etc.)

Drivers Cabin

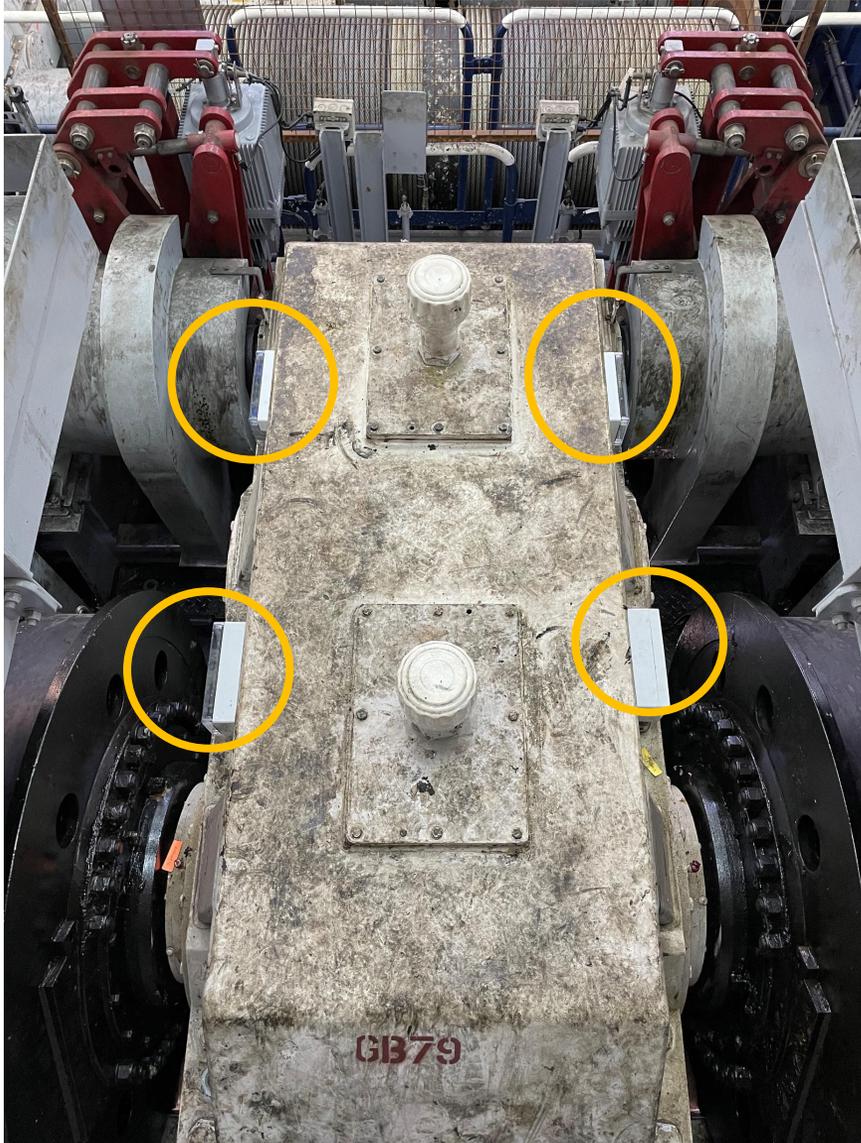

Spreader

Gantry

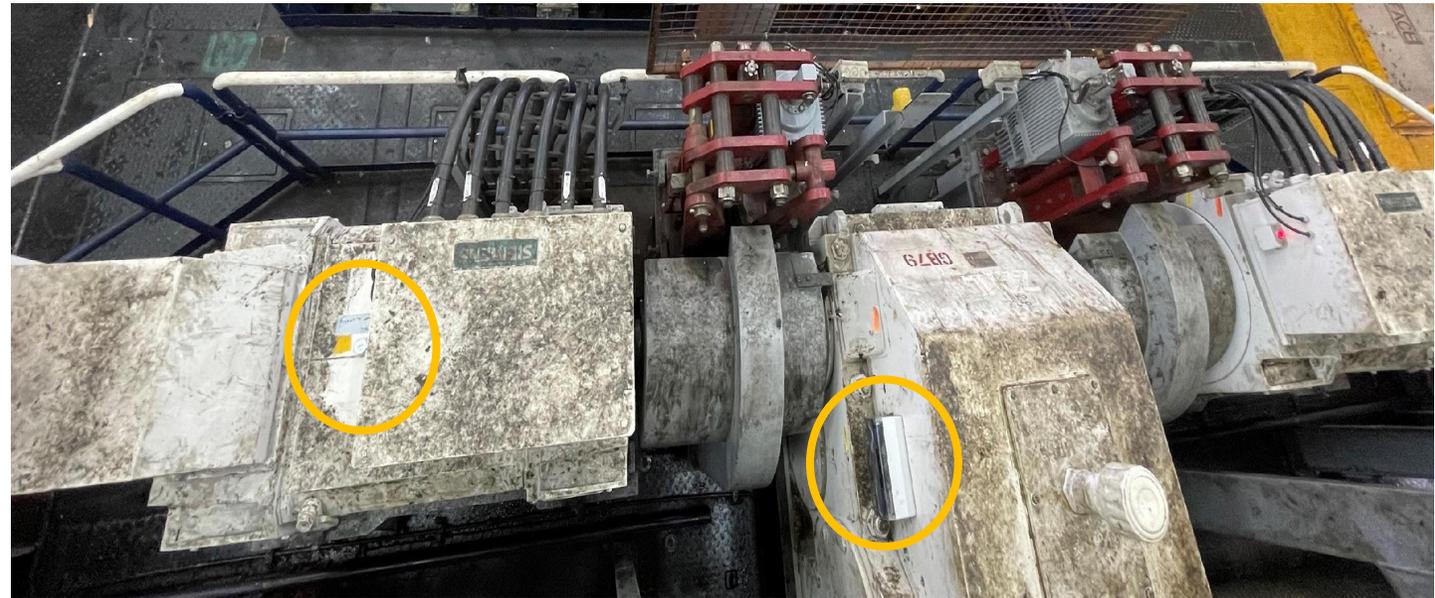

Port of Felixstowe

PORT OF FELIXSTOWE
THE PORT OF GREAT BRITAIN

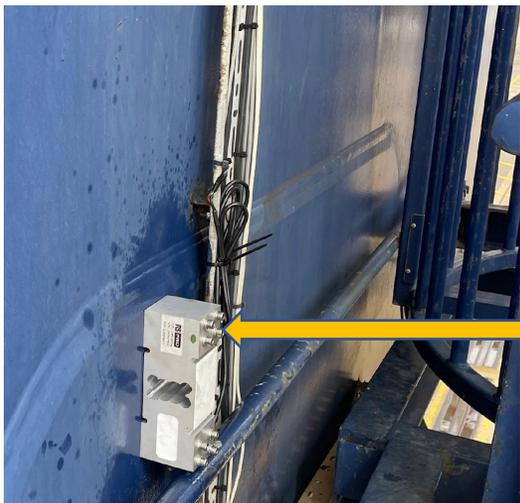

Hoist Area - High Energy - High Maintenance Area

BMS Multi-sensors fitting in weather protective boxes.

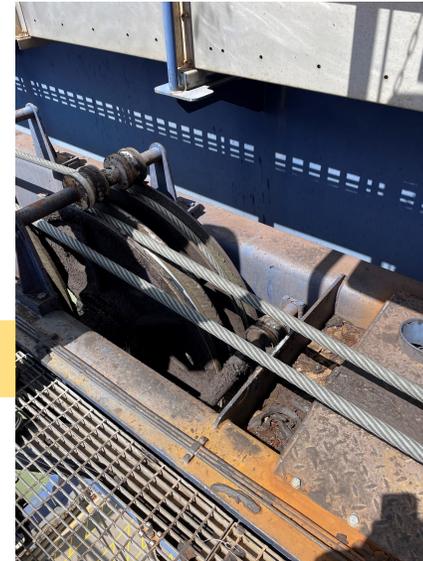

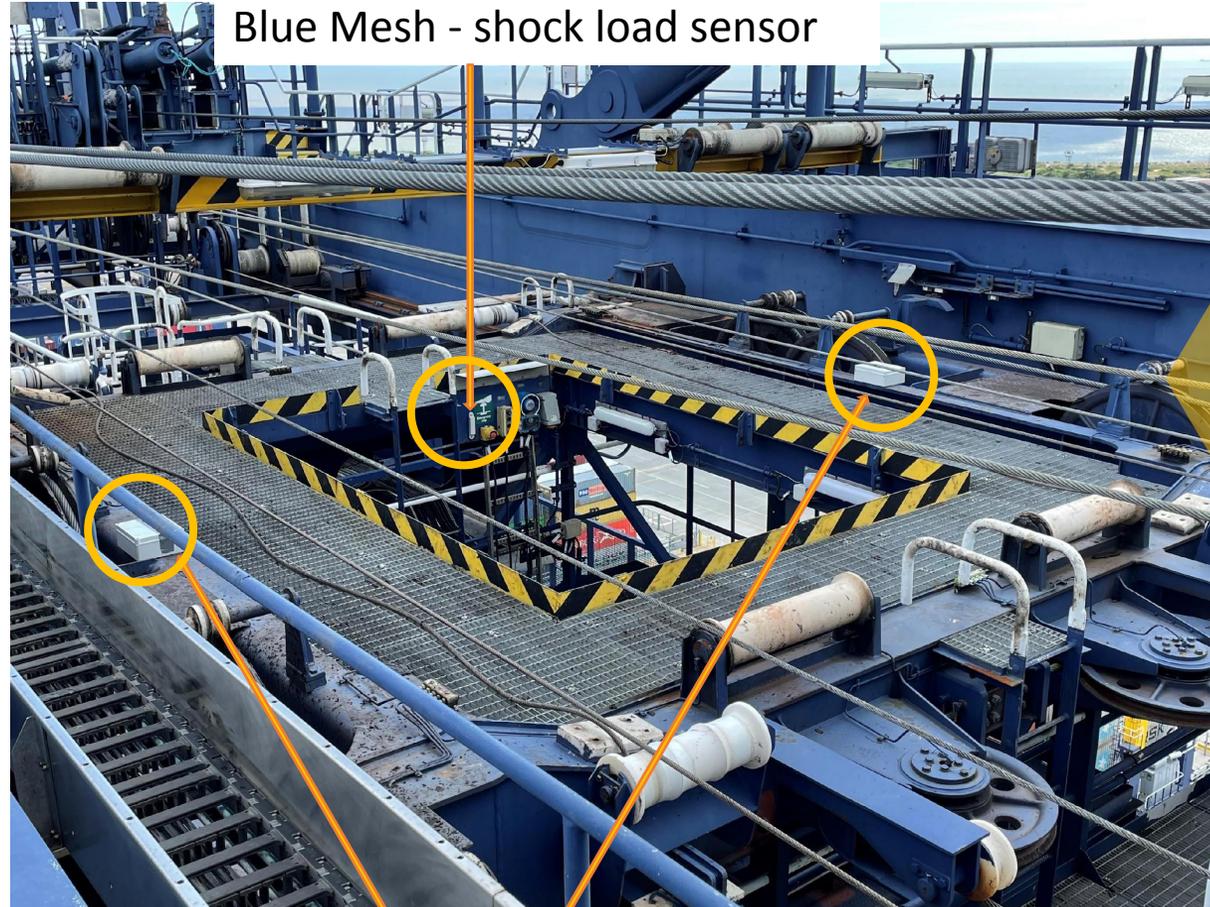

Gantry

Strain gauge

Driver Cabin and Rail

BMS multi-sensor

Could I have the Bill Please ?

One Crane

7 multi-sensors - vibration temperature humidity acceleration acoustics

7 Pi Gateways

2 reasonable spec WiFi Devices in MESH config.

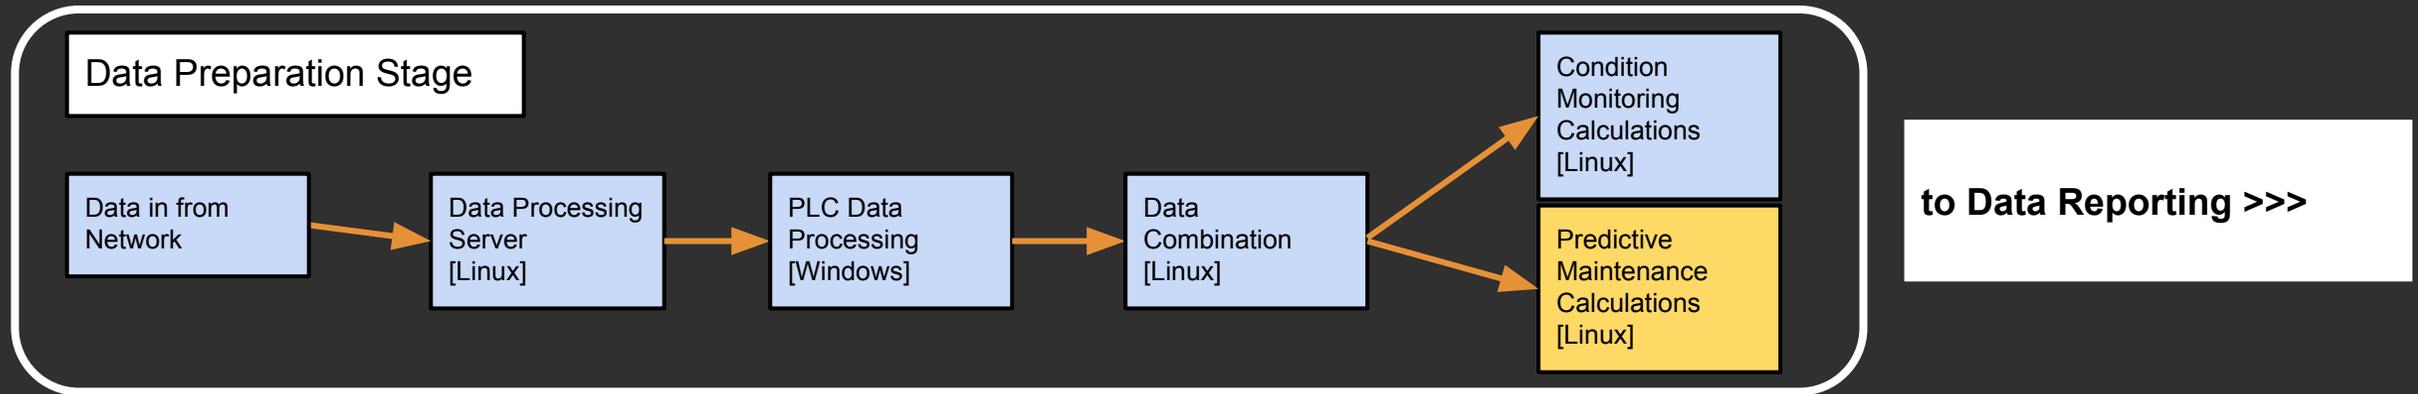

Some cables and bits for mounting

4 Bluetooth MESH devices for Strain Gauges

1 4G / 5G Access Point

Around £2,500.00 of hardware per crane.

What else is needed ? Data Processing using Open Source

Open Source = Linux + Python + Numpy + SciPy + Matplot + GP Plot .

We paid for OPC data tool on Windows - sorry!

So what do I get ?

Condition Monitoring Tools

Vibration Analysis/Dynamic Monitoring

Wear on machine parts, bearings, rotors or shafts can cause them to vibrate in unusual patterns that can be monitored, recorded and analysed. These vibration patterns can be used to identify defects and potential failures, including those due to misalignments, imbalances or even design flaws.

Techniques include:

- Shock (velocity) pulse analysis

- Broadband vibration analysis

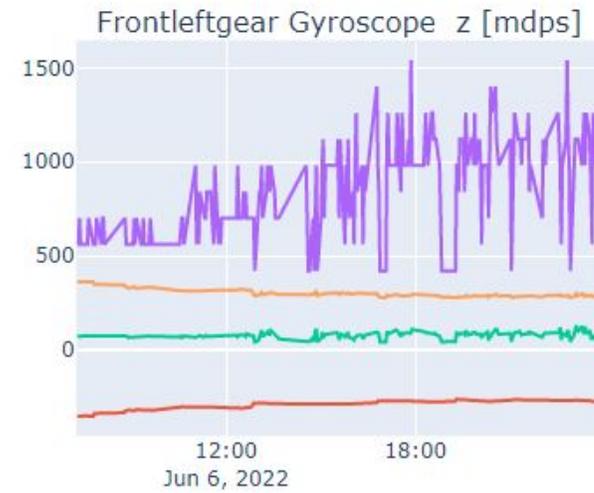

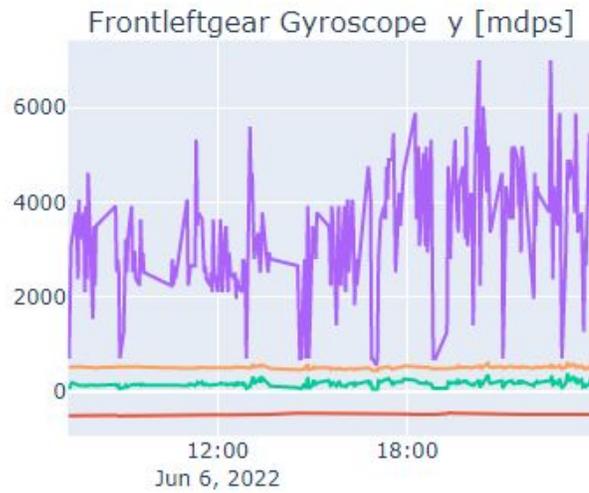

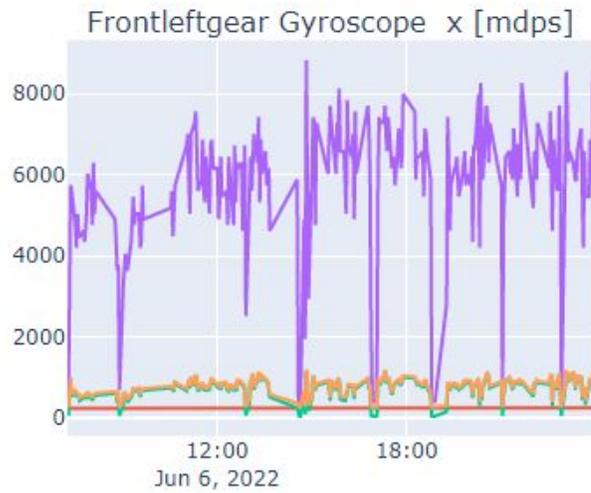

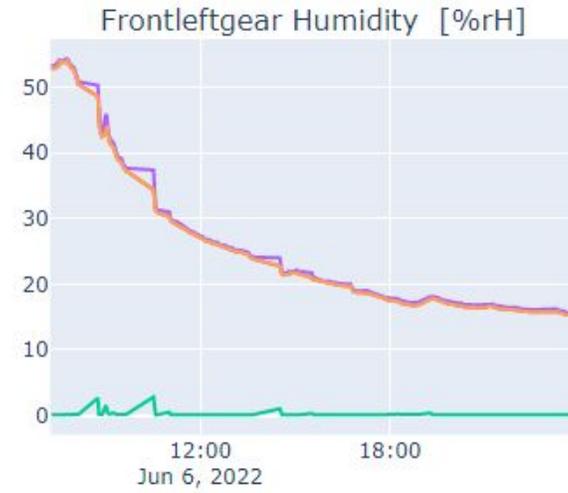

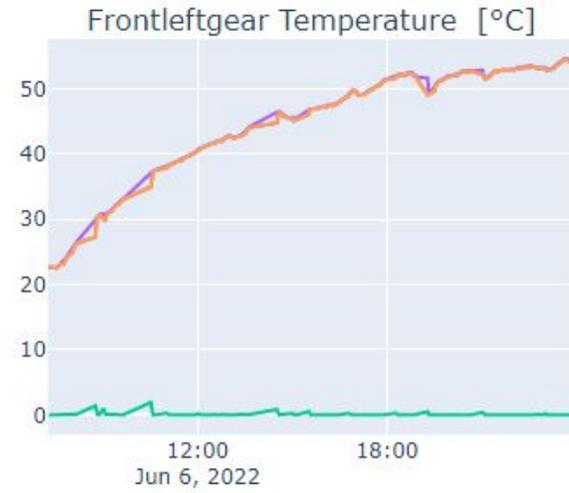

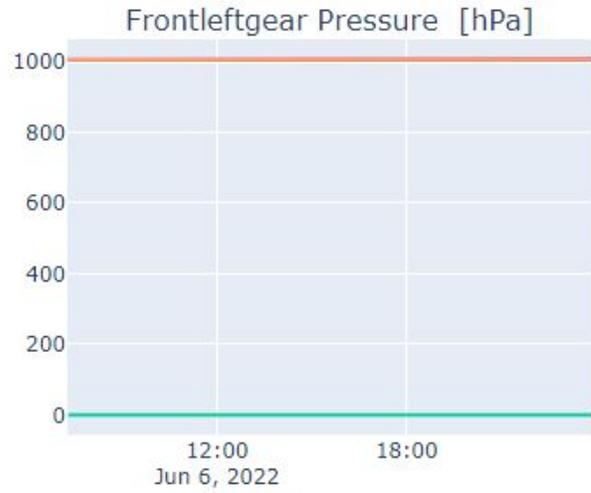

- Fast fourier transforms

- Power spectral density (PSD)

- Spectrogram/spectrum analysis

- Time waveform analysis

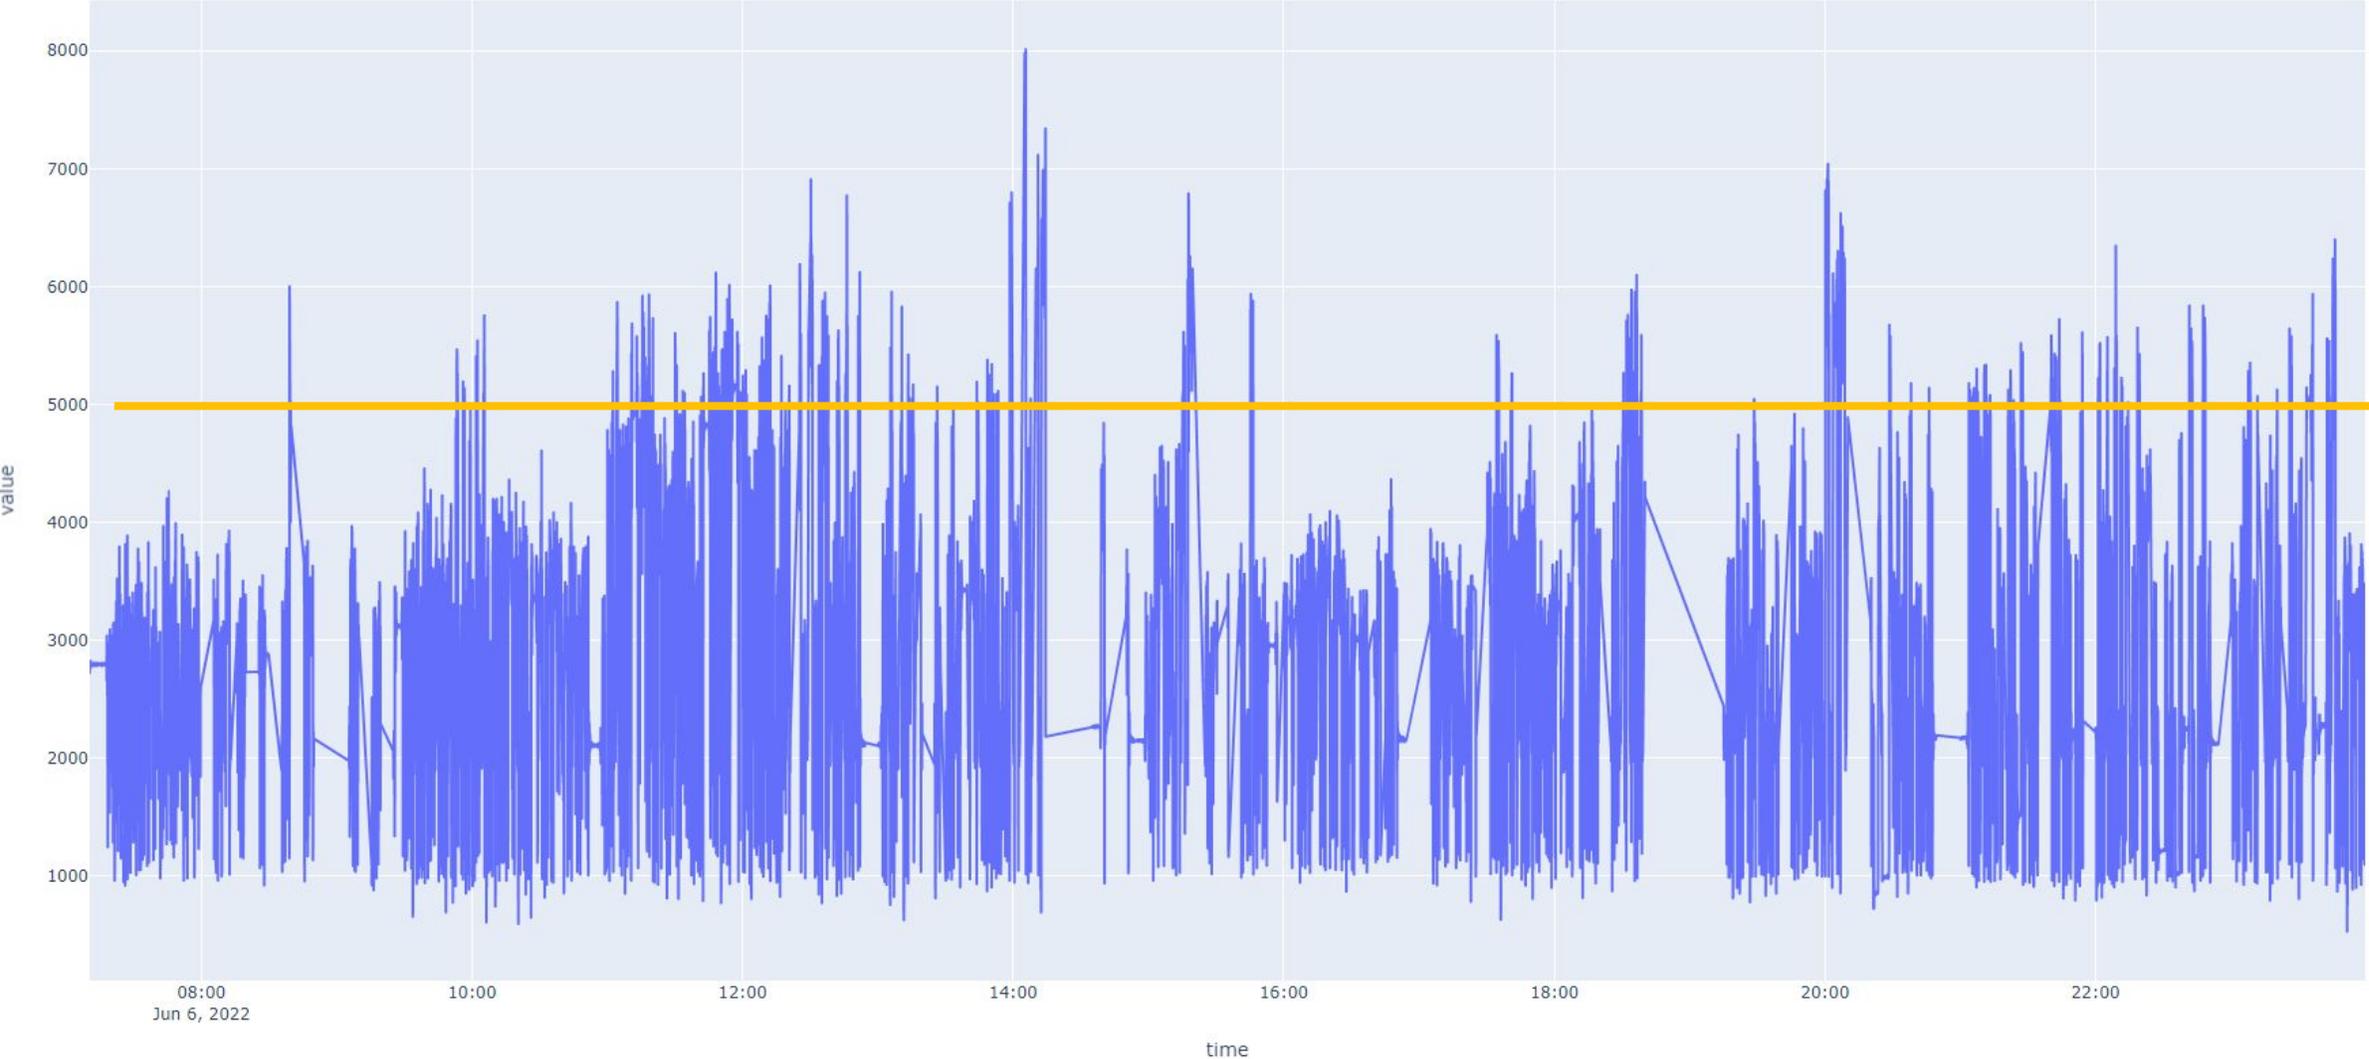

All sensors: Mean, Standard deviation, Absolute Max and RMS

Vibration and acceleration in x y z = 3 axis.
Mean SD RMS

PLC Data - Load lifted 5000 = 50 Tonnes.

Whole day of lifted loads. Divide by 100 to get the value in [t]

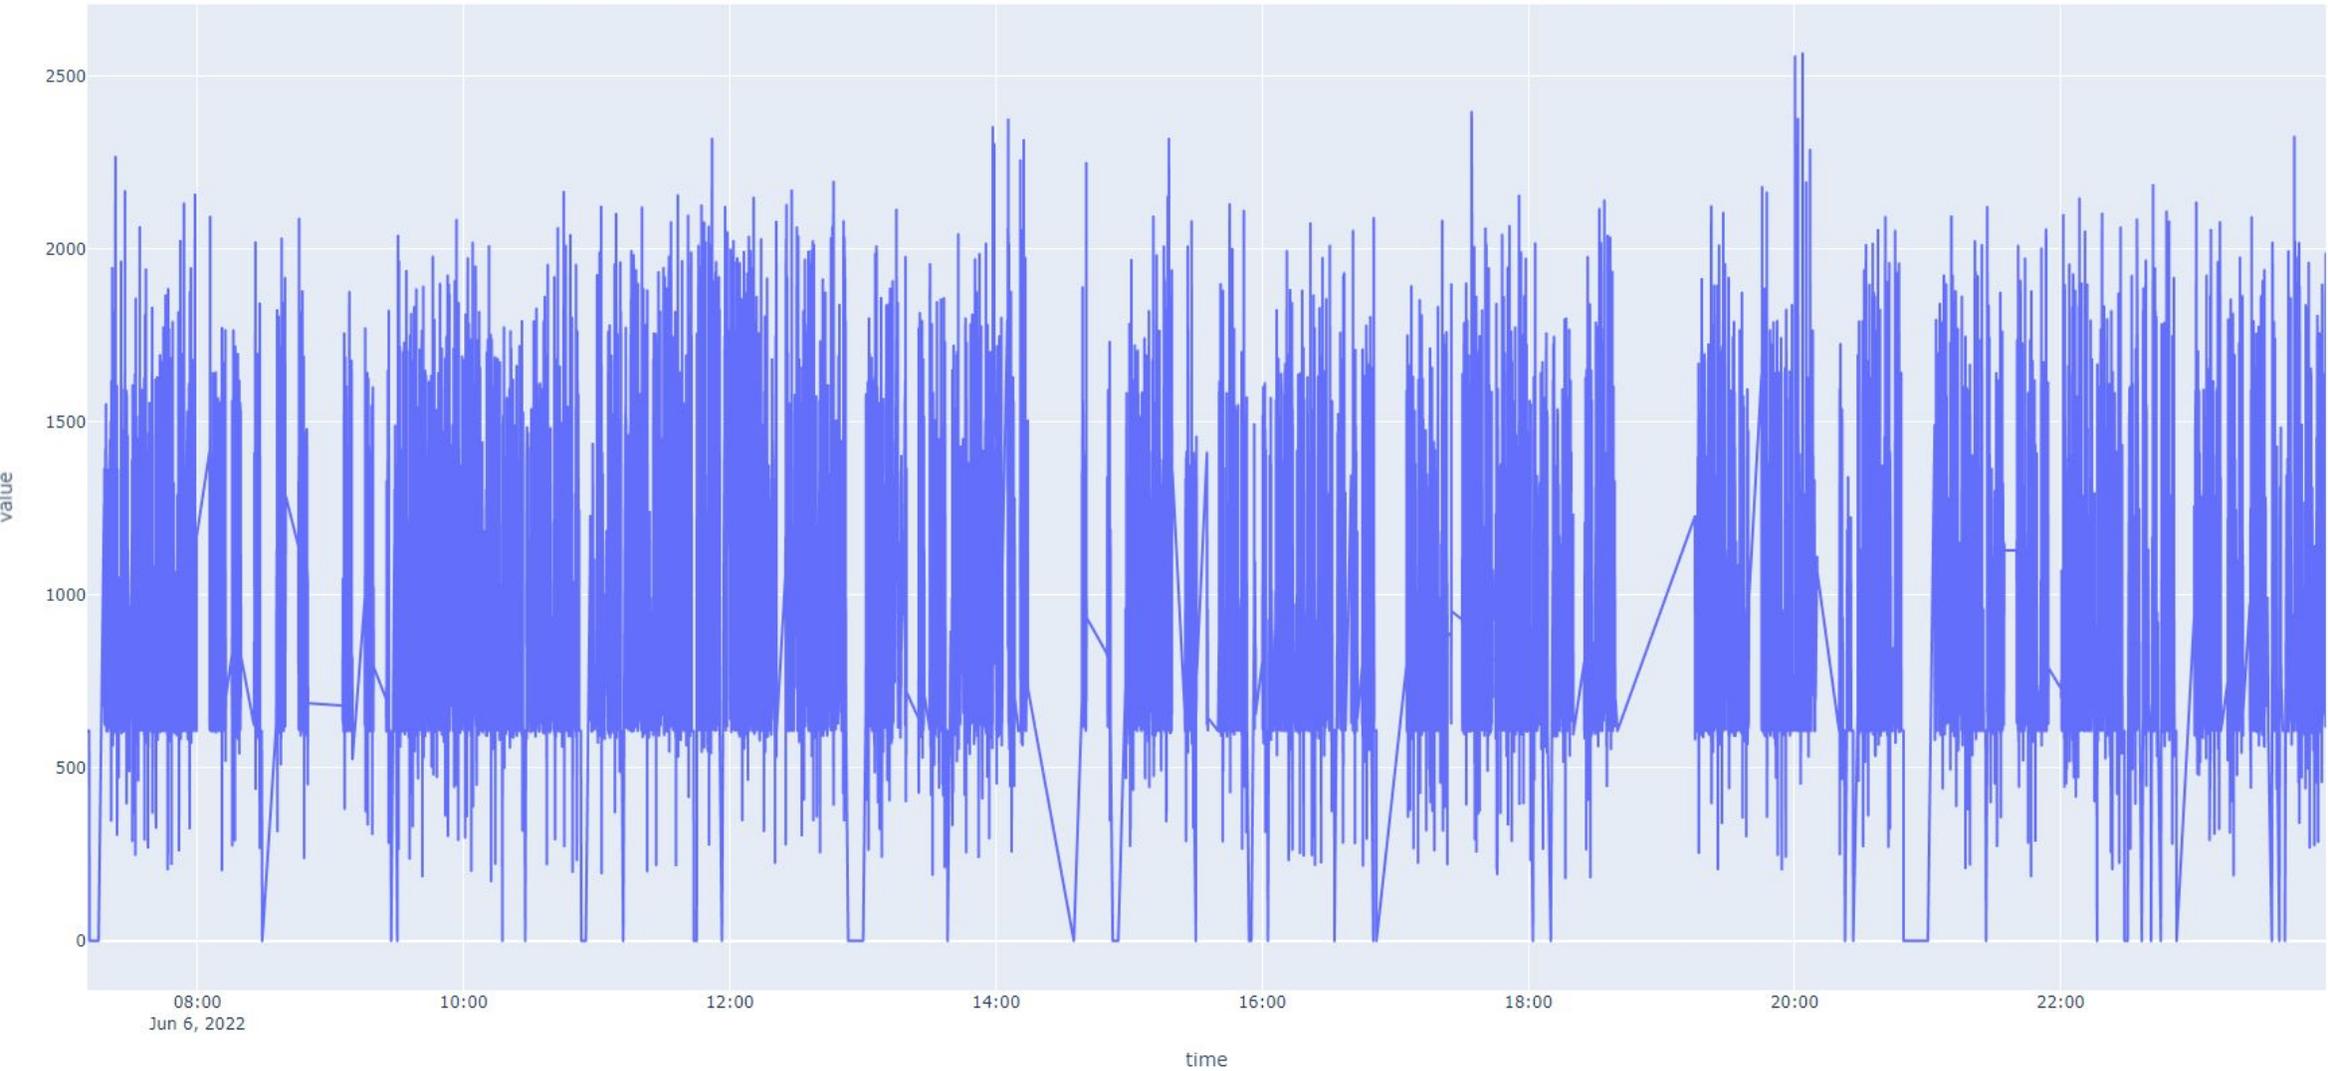

PLC = 40.2 Tonne lift across 45 seconds

Isolated event. Average weight [t]: 40.2

PLC = current for 1 day
Yes that's really 2000 Amps!

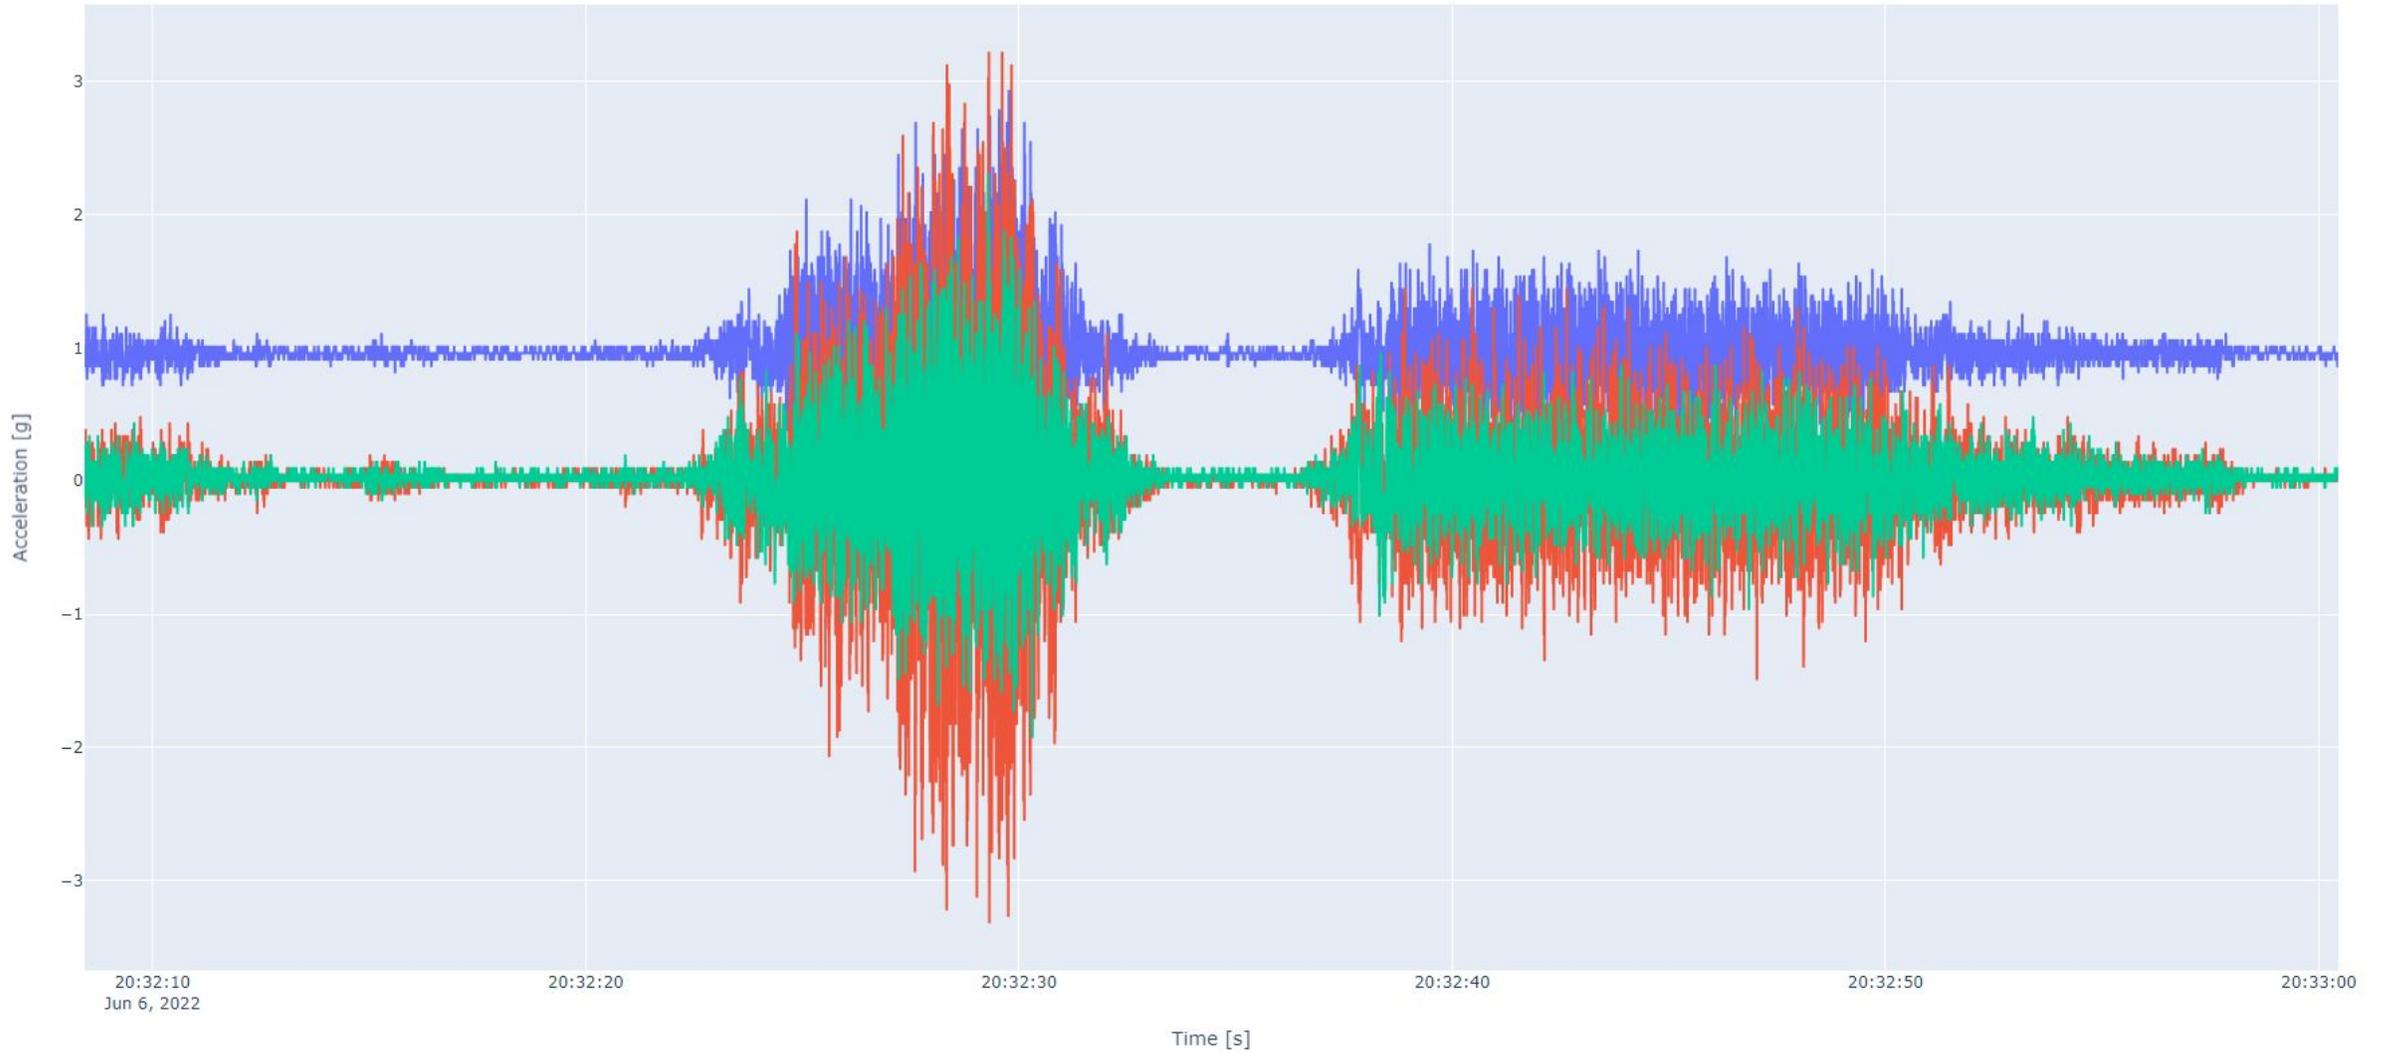

Whole day of hoist motor current

Vibration by direction

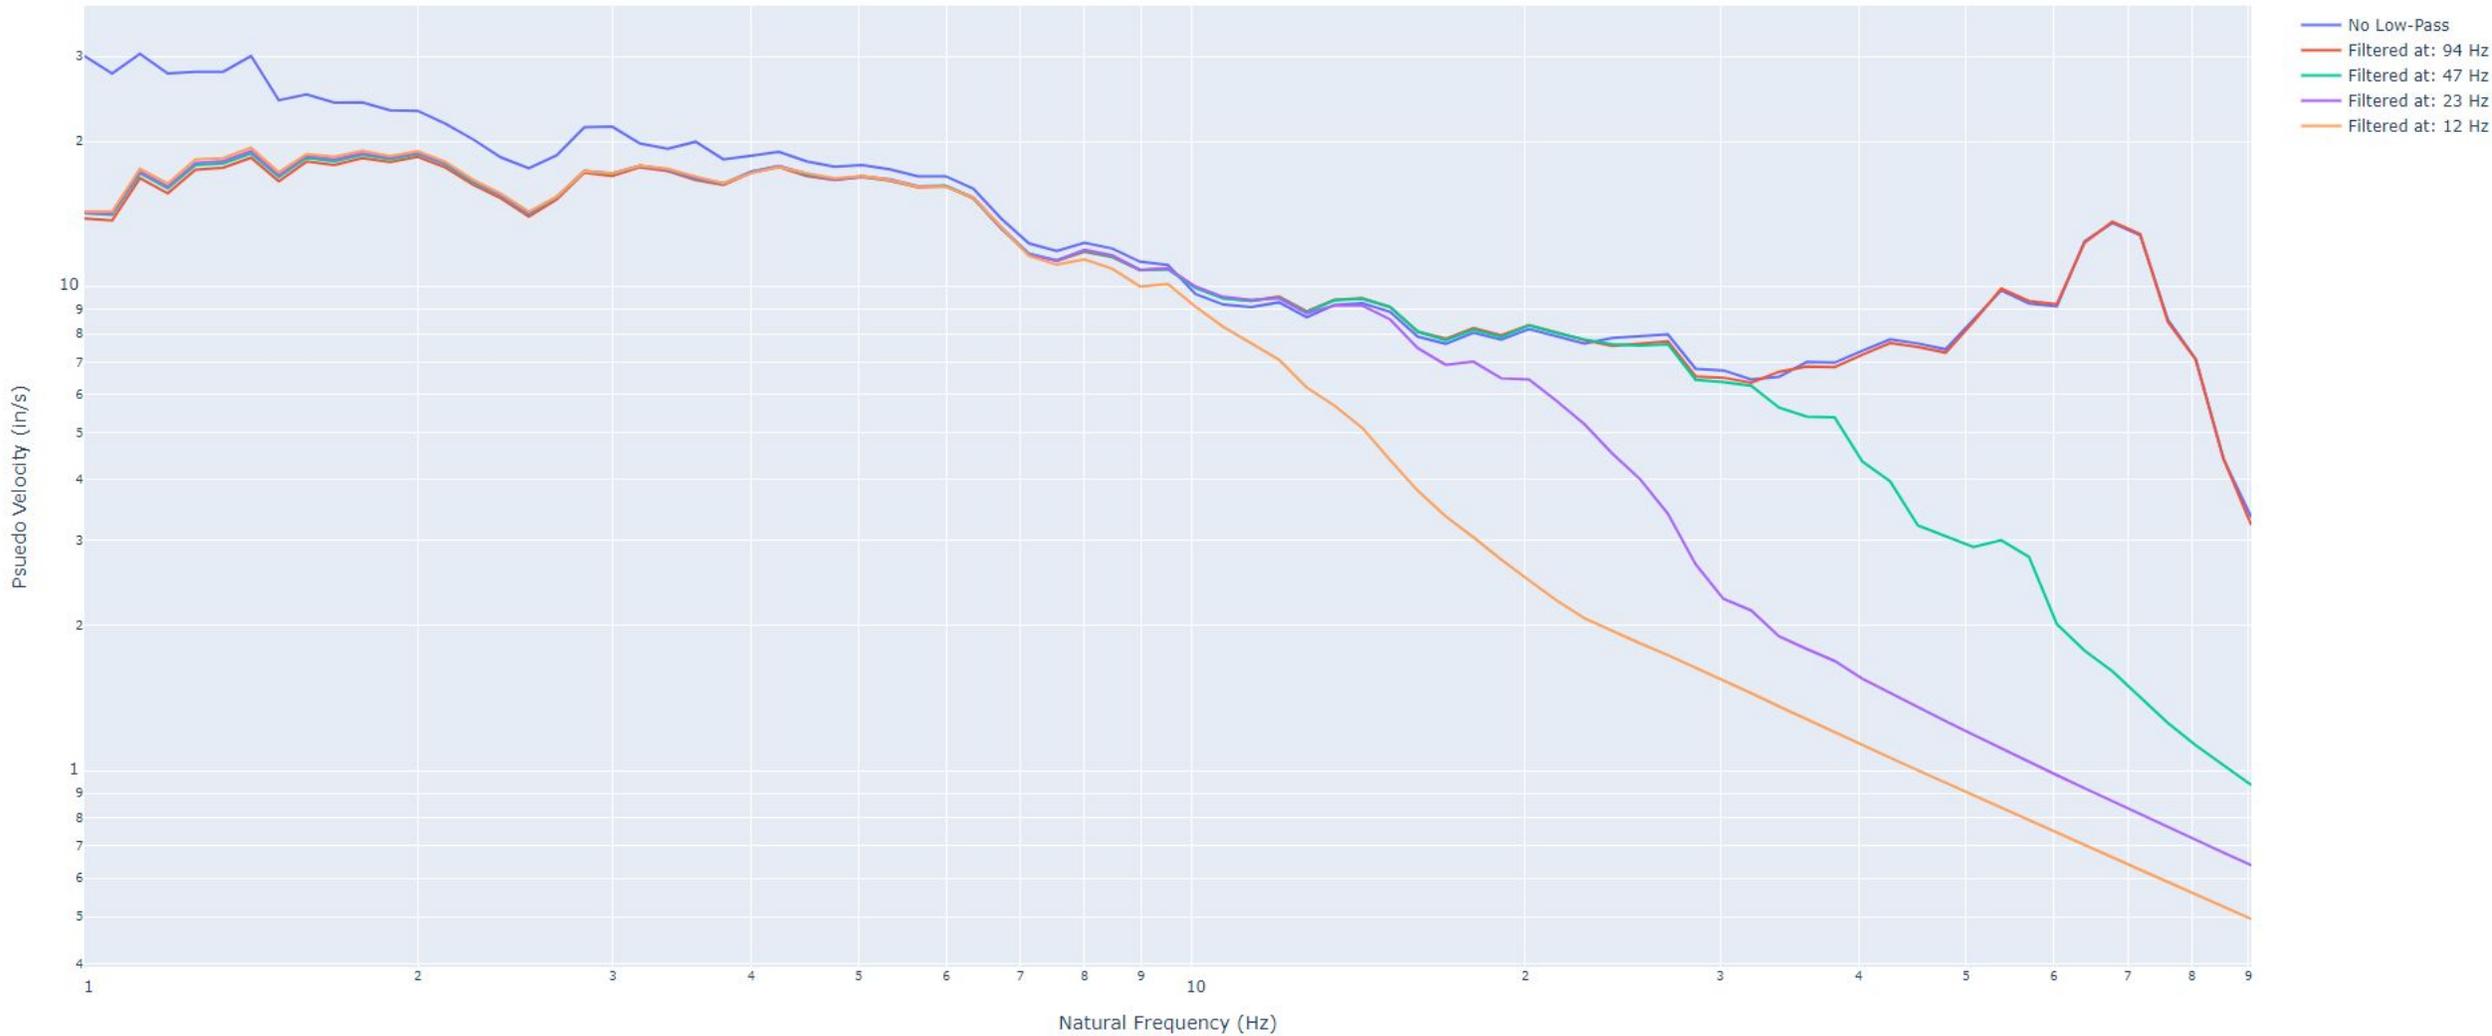

z = green = includes gravity damper

Frontleftgear Vibration: 40.2tons

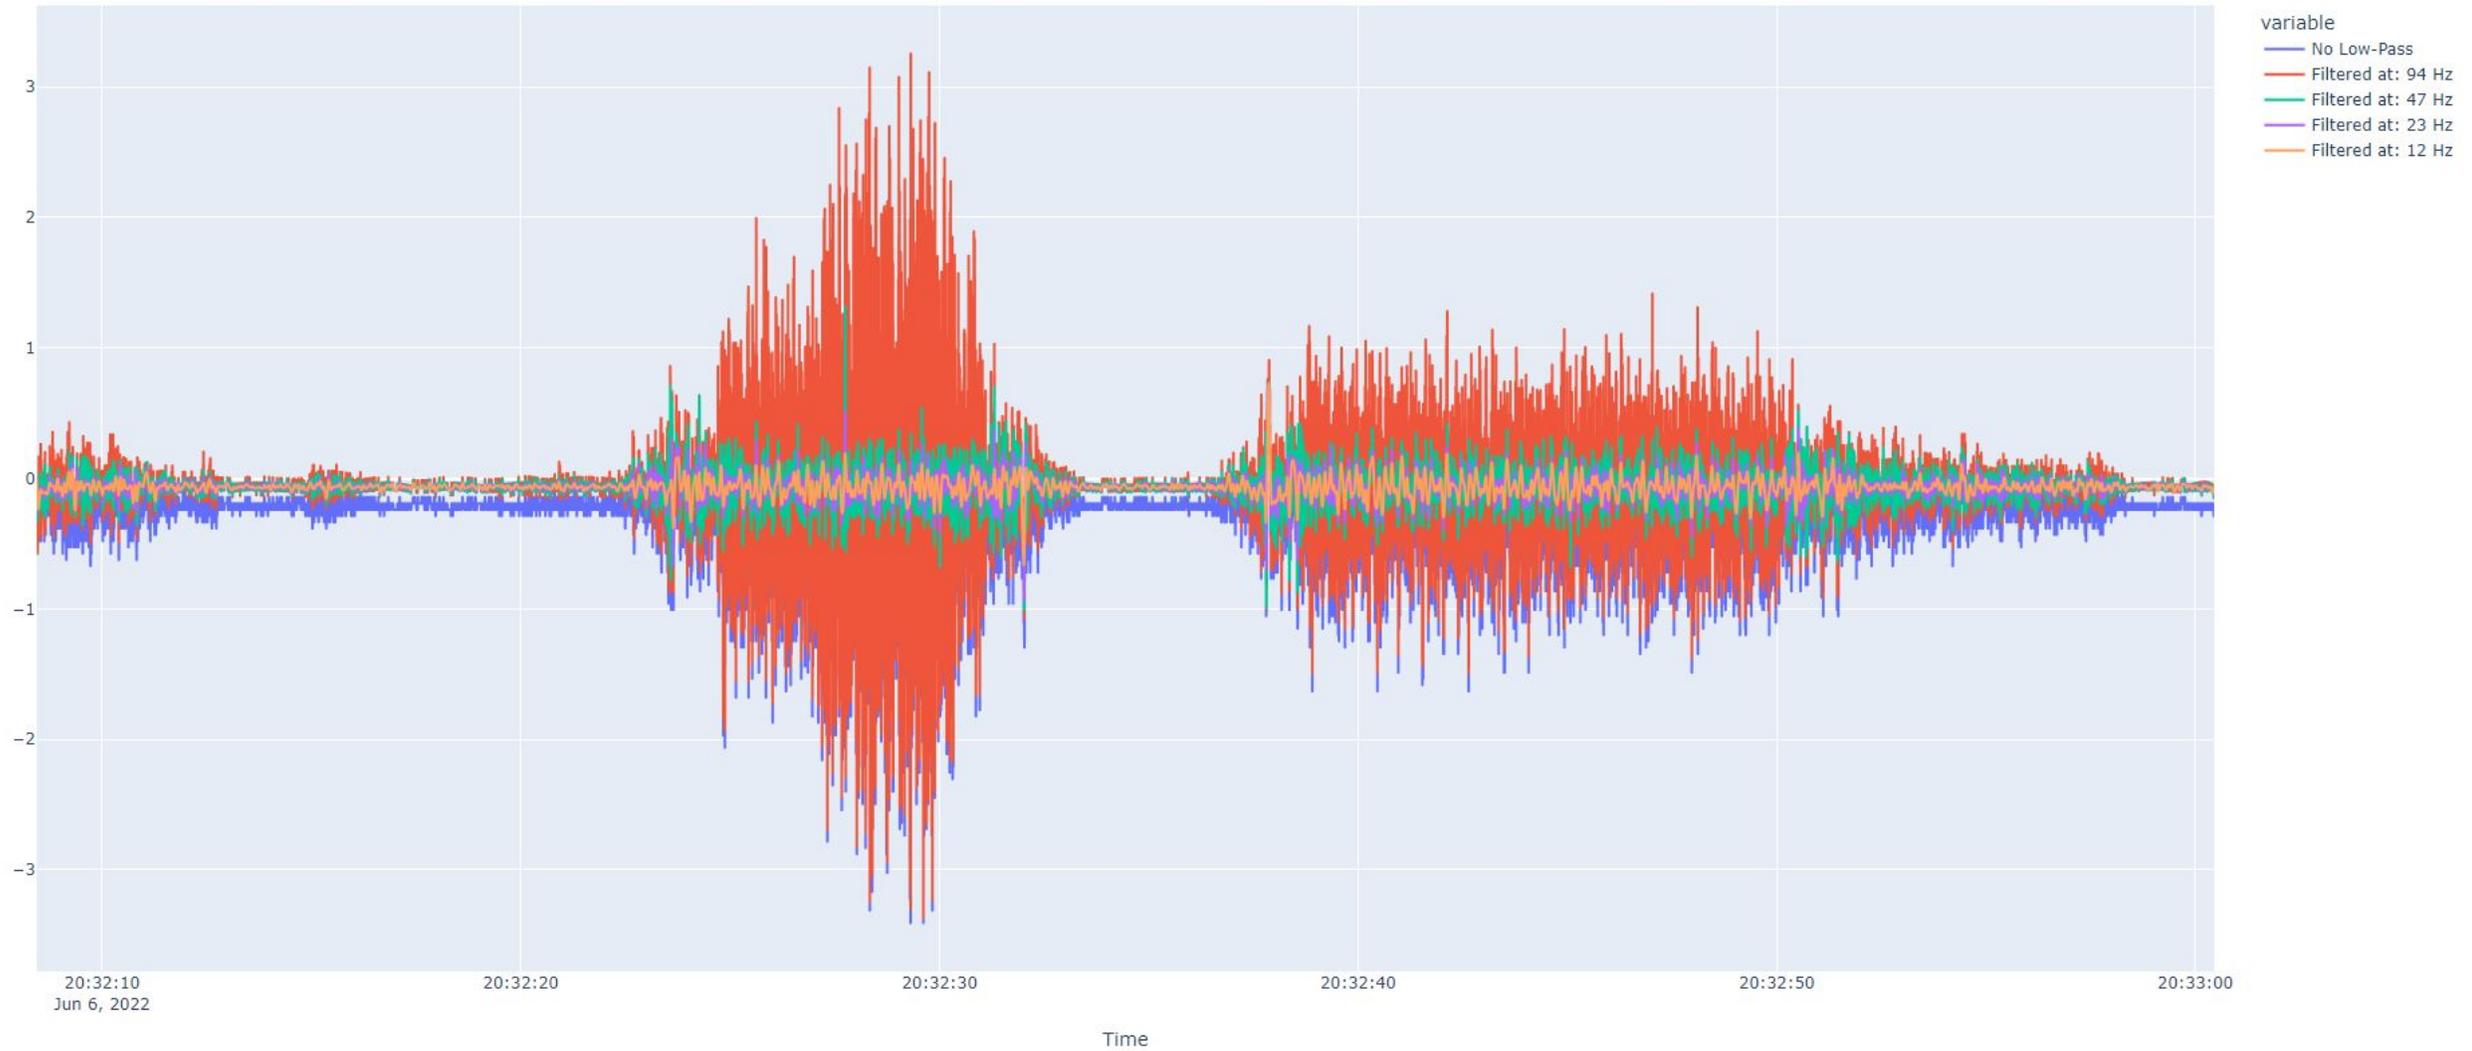

Velocity Shock in System

Pseudo Velocity Shock Spectrum (PVSS) 40.2tons

Frequency Filters

Filtering Vibration Frequencies for event: 40.2tons

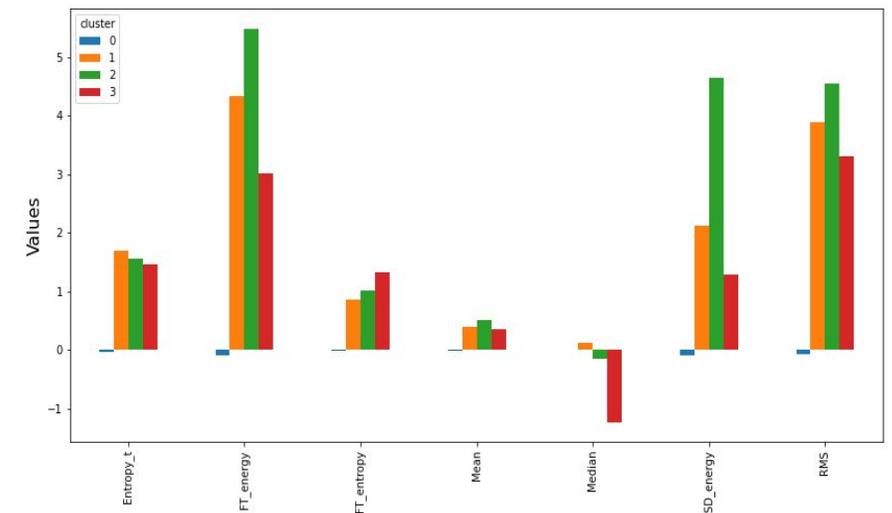

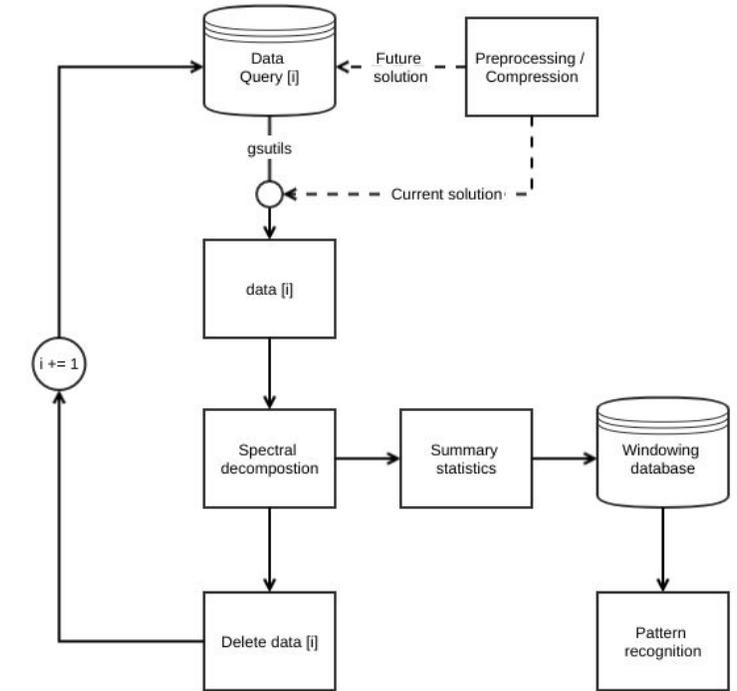

So what do I get ?

Predictive AI Tools

Discord Detection

1. **Feature extraction** from spectral decomposition (DFT/PSD or DWT/CWT)
 - a. FT: Entropy, energy, cross-mean counter, main percentiles, mean, std, var, ...
 - b. WT: scalogram
2. **Feature selection** (max variability in the system)
 - a. Peak analysis / Quantile analysis (to detect discordant data)
3. **Clustering** (k-means / PAM, others)
4. **Labelling** cluster configuration groups by PLC action
5. **Out-of-sample** classification
 - a. Distance to clustering groups (to detect discordant data)
6. **Update clustering** after a number of new data. **Go to 3.**

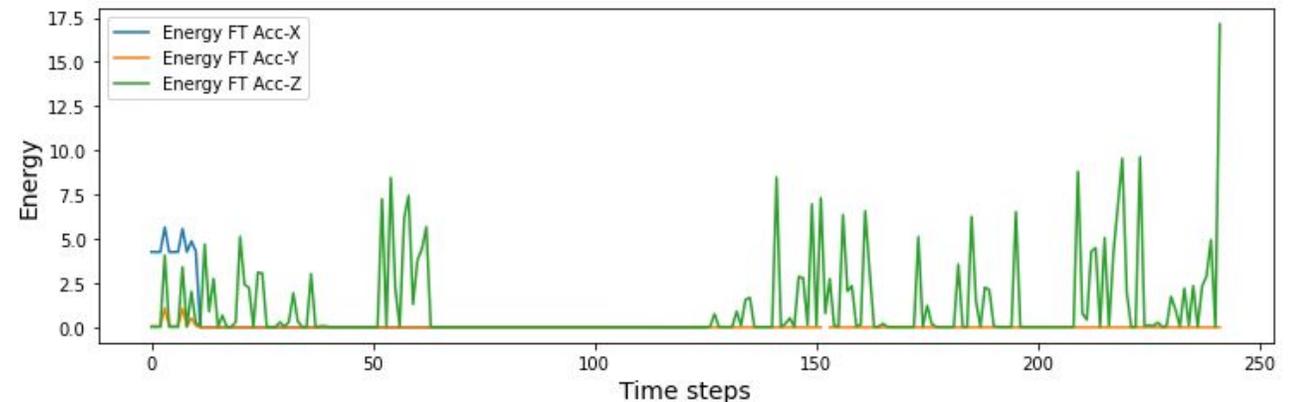

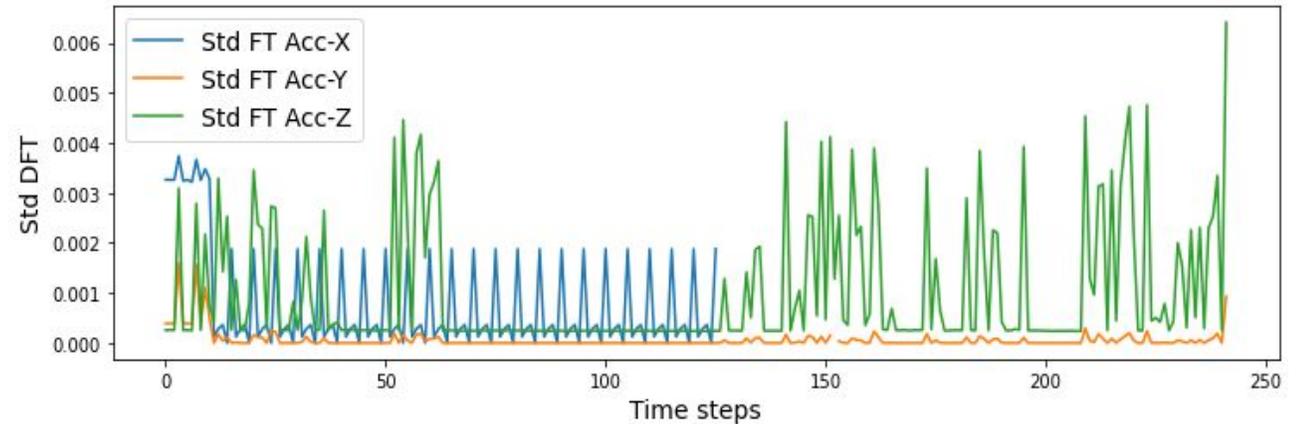

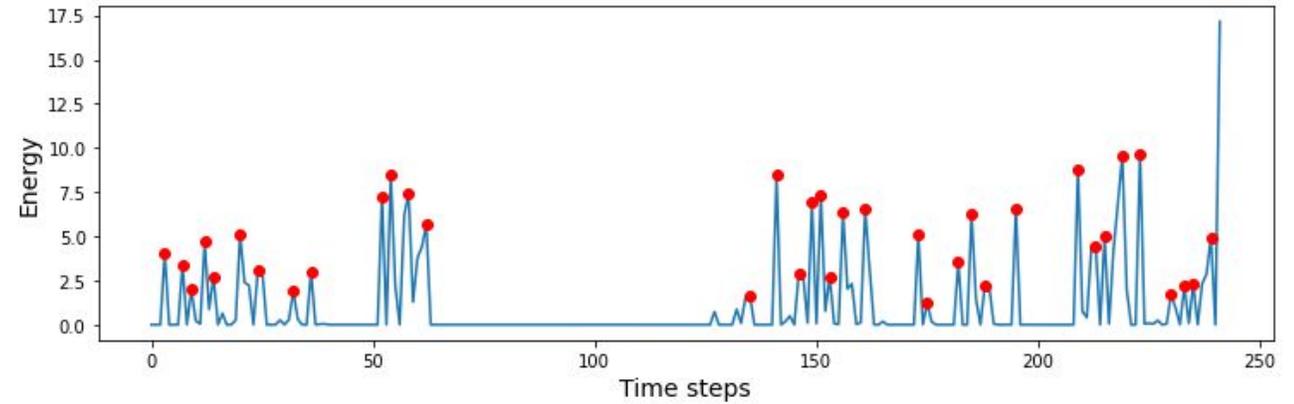

Discord Detection

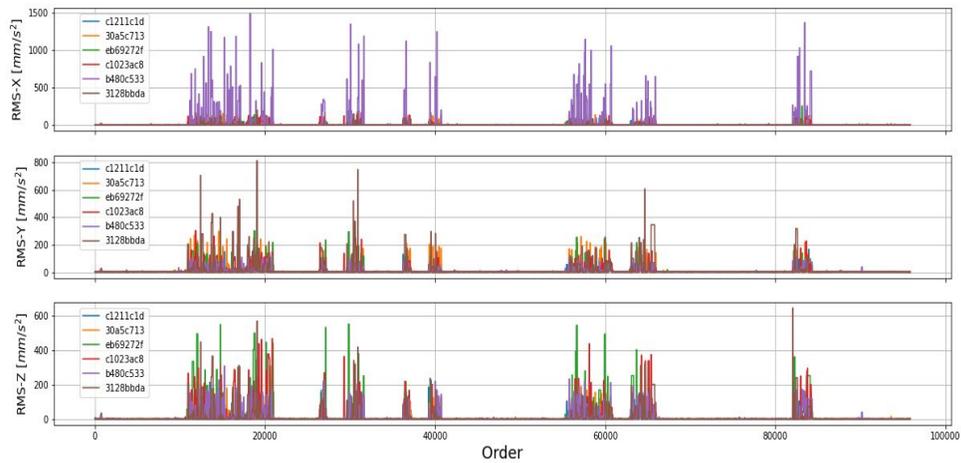

Features considered for DFT and PSD:

- Entropy,
- energy,
- cross-mean counter,
- main percentiles,
- mean, std, var, ...

Note: Energy spectral density describes how the energy of a signal or a time series is distributed with frequency.

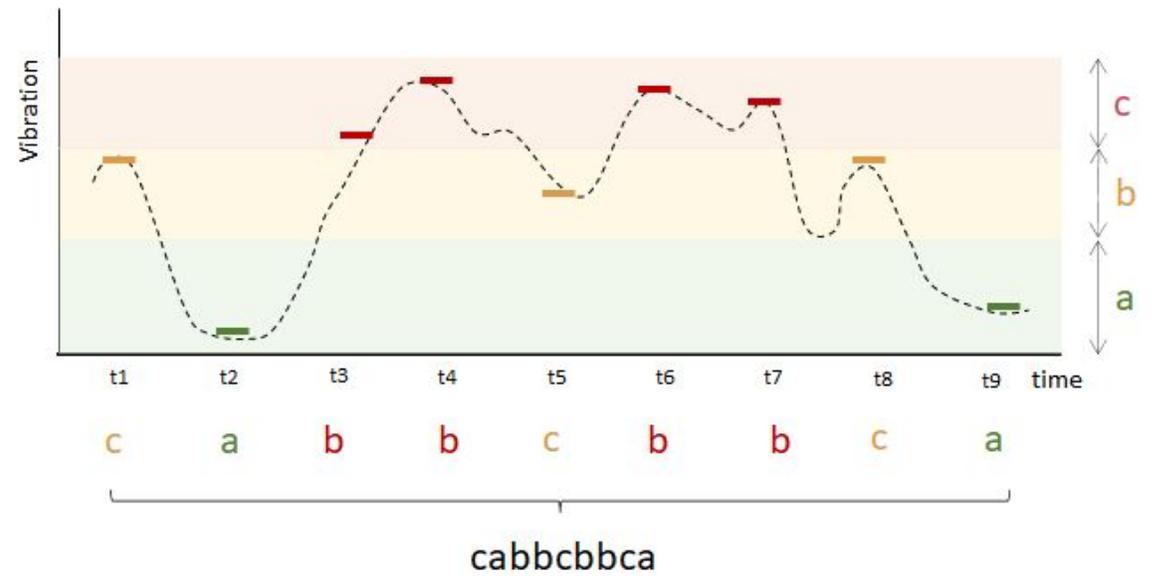

Discord Detection

Reducing dimensionality with SAX

Symbolic Aggregate Approximation

Discord Detection → Decision Making

The screenshot shows a web browser window with the URL 10.100.8.13:3000. The application title is "AI Discords". Under the heading "1 Crane Selection", there are six blue buttons labeled QC51, QC52, QC53, QC54, QC55, and QC56. Below these buttons is a table with the following data:

Crane	Sensor	Start Time	End Time
qc52	backvideo	2022-09-04 07:34:41.769999872+00:00	2022-09-04 07:34:49.720000+00:00

ACTIVE ALARMS STATUS

Long Term Asset Health

Our sensors start at **Vibration**, and end at **Audible Noise** via an Acoustic Sensor and then Good / Bad analysis in the AI Discords.

Conclusions & Discussion

1. Modern sensors are cheap and wide variety
2. Deployment is fast using over the air data collection
3. Pis and Linux are easy to manipulate
4. Battery / solar can be used if power is hard to reach
5. Open Source Libraries are widely available
6. Data Analytics is an Open Source subject today
7. Combining PLC data and Sensor data allows much deeper analysis
8. Global Data Sharing platforms bring together distributed systems
9. AI and Predictive methods can significantly contribute to decision-making when augmented with expert-judgement
10. Short Term Condition Monitoring and AI Predictive
11. Long Term change of asset health for maintenance scheduling and prioritising investments
12. Low cost systems give high value data.

Thank you
